Exploration Licence 6359 covers an area of approximately 6.5 Kilometres square (2Blocks) within the Arunta Block.

The E.L. is to the north east of Arltunga, access can be made by travelling in a north easterly direction on the Arltunga to CLaraville Road and turning right approximately 200 Metres south of the Hale River then travelling along a track in a south westerly direction for 2 Kilometres to the Wipe-out Well. The south west corner of the E.L. is 180 Metres east of the well.

Previous work carried out in this area was commenced by prospectors in the 1890’s in which several small reefs were actually worked. The area was mapped in 1968 - 1972 by the Bureau of Mineral Resources. Amoco Minerals Australia explored part of the E.L. in 1980 - 1984 this included aero magnetic survey in which several magnetic highs were found, believed to be area’s of banded iron formation and magnetite bearing amphibolite. The area was also explored by White Industries in 1988 - 1989.

During exploration for Gold & Rare Earths we discovered 3 old workings, samples taken from these workings varied from 1.29 ppm. at the M1. work site in the south west to 0.30 ppm. in the M3. area to nil in the M2. region on the south eastern section. Garnets were also discovered on a large ridge in the centre of the eastern block which are currently being evaluated for industrial use in abrasive papers, cloth, s and grinding disc, s etc.

Stream sampling is presently being undertaken, results from these should be available in the near future.
E.L. 6359

Exploration Licence 6359 covers an area of approximately
6.5 Kilometres square (2Blocks) within the Arunta Block.

The E.L. is to the north east of Arltunga, access can be made
by travelling in a north easterly direction on the Arltunga
to Claraville Road and turning right approximately 200 Metres
south of the Hale River then travelling along a track in a
south westerly direction for 2 Kilometres to the Wipe-out Well.
The south west corner of the E.L. is 180 Metres east of the
well.

Previous work carried out in this area was commenced by pro-
spectors in the 1890s in which several small reefs were ac-
tually worked. The area was mapped in 1968 - 1972 by the
Bureau of Mineral Resources. Amoco Minerals Australia explored
part of the E.L. in 1980 - 1984 this included aero magnetic
survey in which several magnetic high's were found, believed
to be area's of banded iron formation and magnetite bearing
amphibolite. The area was also explored by White Industries

During exploration for Gold & Rare Earth's we discovered
3 old workings, samples taken from these workings varied from
1.29 ppm. at the M1. work site in the south west to 0.30 ppm.
in the M3. area to nil in the M2. region on the south eastern
section. Garnets were also discovered on a large ridge in
the centre of the eastern block which are currently being
evaluated for industrial use in abrasive papers, cloth's and
grinding disc's etc..

Stream sampling is presently being undertaken, results
from these should be available in the near future.
